1984Subjects: Item type, Current location, Call number, Status, Date due

Women, it seems, are considerably more disposed than men to upgrade themselves into the middle-class and less likely to allocate themselves to the working-class – a finding which confirms the common observation that status consciousness is more pronounced among women. (Martin 1954:58) Additional confirmation comes from self-evaluation studies. The question whether gender or status and power is the motivating force for conversational behavior has been resolved in favor of status and power in the literature. Most studies find that in mixed talks men tend to be more dominating than women. Female physicians were interrupted more often by patients of all social status groups than male physicians. Gender of Physicians. Number of Interruptions. While women now account for half of new medical school students and an increasingly larger number of practicing physicians [4], there is a paucity of information about gender-related differences in physician burnout. Women physicians differ from their male counterparts: They may lack role models, face challenges of dual-career couples, have to reconcile having only a finite number of years for childbearing, face lack of parity in salaries, receive a lower number of promotions to leadership positions, confront both conscious and unconscious biases, and experience higher rates of sexual harassment. Find the best careers for an ENTJ personality type, plus jobs the ENTJ should avoid. Understand what an ENTJ needs to be happy at work, and how ENTJs perform as leaders. They prefer that their work and that of their colleagues be evaluated based on a set of clear guidelines. They appreciate an environment that is businesslike and fair, where performance is evaluated objectively and rewarded generously. ENTJs are typically motivated and hardworking, and want to be recognized for their efforts with money, power, and prestige. An ideal organization for an ENTJ values competence and logical thinking, and includes coworkers who are intelligent and ambitious.

Negative stereotypes about her group's ability create a cognition-impairing mismatch between her desire for high status and the low status that the stereotype ascribes to her. She's dancing backwards in high heels. For women to succeed under stereotype threat situations, they typically "return away from being female", that is, wearing make-up, being emotional, wanting children; they strategically shed feminine qualities to counter the threat perception.

Women physicians add a tremendous amount of strength to the field of medicine, and health care leaders — from hospital executives to medical school deans — need to do a better job of retaining these women and developing them as leaders. The authors combed through research to identify factors contributing to gender disparities in the field (including implicit gender and maternal bias, and system-wide policies that disadvantage women) and how organizations can start addressing them.
