There are many methods to investigate protein-protein interactions which are the physical contacts of high specificity established between two or more protein molecules involving electrostatic forces and hydrophobic effects. Each of the approaches has its own strengths and weaknesses, especially with regard to the sensitivity and specificity of the method. A high sensitivity means that many of the interactions that occur are detected by the screen. A high specificity indicates that most of the What is a protein? What is a protein? The word protein is derived from the Greek proteios, meaning "of the first rank". The term was coined in 1838 by the Swedish scientist J ns Berzelius, to reflect the importance of this group of molecules. A stretch of DNA called a gene carries the information required to build a
