Not many aquatic insects have been listed as threatened or endangered, but that is only because we have only begun to study their distribution and population numbers. Many species of aquatic insects are very susceptible to pollution or alteration of their habitat. In fact, aquatic insects are the group of living things used most commonly for monitoring the health of aquatic environments. What Are Aquatic Insects? Insects are invertebrates (animals without a backbone) that are part of the larger group of animals called arthropods. Aquatic organisms 307. Many aquatic insects use streamside vegetation during emergence and adult stages of their life cycle. Some aquatic insects leave their positions among boulders and gravel in riffles and are carried downstream short distances before reattaching to the stream bottom. When insects are moving in a water column, as drift or during emergence, they are most vulnerable to being eaten. Aquatic insects are easy to identify if you know a few things about their body parts. Even a simple key will require you to know the difference between the head, thorax and abdomen of an insect before you can classify it into a group, like a stonefly, mayfly, or caddisfly. Procedure. Now, it's your turn!

These aquatic insects have adapted to swimming underwater and come to the surface occasionally to collect air. They have a water bubble under their abdomen, where they store air and also prevents water getting into their spiracles. shareÂ James G. Needham has written: 'The Odonata of Chile' -- subject(s): Neuroptera, Dragonflies 'Aquatic insects in New York State' -- subject(s): Insects, Aquatic insects 'The dragon-flies (Odonata) of Illinois, with descriptions of the immature stages' -- subject(s): Odonata 'A manual of the dragonflies of North America (Anisoptera)' Aquatic insects are integral components in the structure and function of inland waters and serve vital roles in the processing of organic matter, the cycling of nutrients, and as prey for aquatic, terrestrial, and aerial predators. From: Encyclopedia of Inland Waters, 2009. Related termsÂ Aquatic insects are derived from various terrestrial ancestors that have secondarily invaded aquatic environments and therefore do not represent a distinct taxonomical unit within the class Insecta. Some insect orders contain only species that are aquatic in some life stages (e.g., mayflies, stoneflies, dragonflies, caddisflies, megalopterans), whereas other orders contain both aquatic and terrestrial species (e.g., beetles, bugs, butterflies, neuropterans, orthopterans, and dipterans).
