An important application of the electro-optic effect is in controlling the coupling between two parallel waveguides in an integrated-optical device. This can be used to transfer the light from one waveguide to the other, so that the device serves as an electrically controlled directional coupler. Many assumptions have been made to keep the foregoing theory simple: In deriving (18.4-8) from (18.4-6) it was assumed that the ratio of number densities of unionized to ionized donors is approximately uniform, despite the spatial variation of the photoion-ization process. Fundamental interest still continues but more and more side branches have. evolved fruitfully. This collection of papers was, therefore, brought together to. take a fresh look at this traditional field. Further, we are to celebrate 35 years of a. successful conference series, ELOPTO, with the last one held at Waldthausen.
