Modern Methods of Teaching " Learning Mathematics and Related Subjects. The publication was financed from the European Commission funds under Erasmus+ The publication was financed from the European Commission funds. A Modern teaching requires transition from teacher's subjectivity to that of a student. The process of learning and self-improvement should rely on students' understanding the structure, functions and integration of the brain, sensory preferences, differences in functioning brain hemispheres, brain dominance profiles, learning styles, copying with stress, and the different types of memory. A thorough analysis of operations within concepts, which must be acquired by students, is the starting point for planning and selecting tasks. H- and C-NMR are really useful to determine the structure because they give information about the number of these atoms and also about the electron density near them. Massspectrometry furnishes information about the presence of halogen elements, oxygen, sulfur, nitrogen an so on. Infra-Red is used to determine the presence of functional groups and its also really fast. Its not that useful to determine if there is halogen in presence or which one of them(in this case better Massspectroscopy). The spectrum of each organic compound contains "fingerprint". If the tested compound has the same finge

"A Course of Modern Analysis" by E. Whittaker, first published in 1902, covers analytic functions, infinite series, Fourier series, Riemann integration etc. - all topics that today we would just call "analysis". On the other hand "Introduction to Modern Analysis" by S. Kantorowicz, published in 2003, covers measure theory, functional analysis, Banach algebras, spectral theory etc. i.e. a more abstract and generalised treatment of analysis.

Classical organization theory Neoclassical theory Modern theories The research organization as a social system Process in the organization References. Organizational theories which explain the organization and its structure can be broadly classified as classical or modern. Classical organization theory. Modern theories tend to be based on the concept that the organization is a system which has to adapt to changes in its environment. In modern theory, an organization is defined as a designed and structured process in which individuals interact for objectives (Hicks and Gullet, 1975). Decision analysis is also considered to be a linking process in the systems approach. Decisions may be to produce or participate in the system.

Structures subject to this type of analysis include all that must withstand loads, such as buildings, bridges, vehicles, furniture, attire, soil strata, prostheses and biological tissue. Structural analysis employs the fields of applied mechanics, materials science and applied mathematics to compute a structure's deformations, internal forces, stresses, support reactions, accelerations, and
