OSPF Design Guide Introduction Shortest Path Algorithm Areas and Border Routers Link State Packets Enabling OSPF on the Router
OSPF Authentication The Backbone and Area 0 Virtual Links Neighbors Adjacencies. Introduction OSPF (Open Shortest Path First) protocol was developed due to a need in the internet community to introduce a high functionality non-proprietary Internal Gateway Protocol (IGP) for the TCP/IP protocol family. Cisco OSPF Design Guide. better aggregate link bandwidth and slower delays. RIP networks are flat networks. OSPF DESIGN GUIDE. Cisco Systems Network Supported Accounts Rev: 1.1 April, 1996. Sam Halabi Network Consulting Engineer. The Open Shortest Path First Protocol (OSPF), defined in RFC 1583, is an Interior Gateway Protocol used to distribute routing information within a single Autonomous System. This paper examines how OSPF works and how it can be used to design and build today's large and complicated networks. OSPF DESIGN GUIDE-NSA group. April 25, 1996. 1. Cisco CCNP ROUTE Open Shortest Path First. If you remember, we discussed link state routing protocols and identified that they require more administration. This design administration requires that all OSPF routers are configured in a hierarchical area design. RIP & IGRP use the Bellman-Ford algorithm to find their best route, OSPF uses the Dijkstra algorithm to find the shortest path to remote networks. OSPF uses protocol value 89 in the IP packet. OSPF communicates through the use of multicast packets. All OSPF routers participate in multicast group 224.0.0.5. All OSPF designated routers

Information About OSPF. Cisco OSPF Implementation. Router Coordination for OSPF. Route Distribution for OSPF. OSPF was designed expressly for IP networks and it supports IP subnetting and tagging of externally derived routing information. OSPF also allows packet authentication and uses IP multicast when sending and receiving packets. Cisco supports RFC 1253, OSPF Version 2 Management Information Base, August 1991. Route Distribution for OSPF. Cisco OSPF Implementation. The Cisco implementation conforms to the OSPF Version 2 specifications detailed in the Internet RFC 2328. The following list outlines key features supported in the Cisco OSPF implementation: Stub areas The definition of stub areas is supported.
