Urban water supply planning has changed greatly in recent decades, and has generally become a much more technically serious endeavor. (Urban water supply has always been a politically serious endeavor, with abundant sources of uncertainty (Lund, 1988a, b).) Yet for all the serious and fine technical work and research on urban water supply engineering and economics, it often seems that such work has not provided a clear unified approach for combining the many technical measures available for water supply system planning and management. The planning and management of urban water supplies in California has undergone great changes in recent decades with adoption of demand management measures and more recent recognition and use of water transfers. Integrated urban water management (IUWM) is a philosophy of varying definitions and interpretations. According to the authors of the book entitled, "Integrated Urban Water Management: Humid Tropics", IUWM is described as the practice of managing freshwater, wastewater, and storm water as components of a basin-wide management plan. It builds on existing water supply and sanitation considerations within an urban settlement by incorporating urban water management within the scope of the entire river. Get up to speed on the latest urban water management tools and techniques. Here's the only resource you need to master the latest water forecasting. This landmark reference clearly demonstrates why management of demand is critical to urban water supply planning--and also presents detailed methods to application. The book examines the many new physical, financial, and political challenges facing water supply agencies, and provides you with: A historical perspective on urban water demands and how and why they have changed over time; Methods for analyzing urban water demands; Techniques for optimally integrating planning and management activities for both supply and demand.

Water Demand Management (WDM) requires a holistic approach that recognizes the complexity of the inter-relationships among all the factors affecting water demand. It calls for the creation of an enabling environment based on an adequate set of mutually supportive policies and a comprehensive legal framework with a coherent set of incentives and regulatory measures to support these policies. The main disciplines and topics of Plan Bleu activities are water, energy, transport, tourism, waste, rural areas and agriculture, urban and coastal areas, and marine and forest ecosystems. There are also related cross-cutting issues such as global climate change. A variety of tools and methods are used such as indicators, spatial analyses, and economic approaches.
