'The Book of the Cosmos: Imagining the Universe from Heraclitus to Hawking,' by Dennis Richard Danielson (ed.), \$34, Amazon. Think of this as the advanced companion to *Cosmographics*. Danielson, an intellectual historian, has compiled landmark texts in the discovery of the universe, many of them impossible to find outside of deep library research. Hartle and Hawking have made the 'no-boundary' proposal, that the wavefunction of the universe is given by a path integral over all compact Euclidean 4-dimensional geometries and matter fields that have the 3-dimensional argument of the wavefunction on their one and only boundary. This proposal has had several partial successes, mainly when one takes the zero-loop approximation of summing over a small number of complex extrema of the action. This book contrasts two imaginings of 1960s London: the excess and comic vacuousness of Swinging London, and the radical politics generated by the city's counter-culture. These disparate perspectives combine to form a shared imagination associated with a new understanding of nature, which differently positioned humanity and technology.
