In the central region of New Zealand whaling was based primarily (Dawbin, 1966) on harpooning sperm whales, *Physeter catodon*; humpback whales, *Megaptera novaeangliae*; and southern right whales, *Eubalaena australis*, when these whales moved through Cook Strait, the sole channel between the North and South Islands of New Zealand (Figure 1). ...^Â Distribution of whales and dolphins in the Far-Eastern seas and in the North-Western Pacific is considered. In 1995 abundance of whales and dolphins (752 specimens) was intermediate between their numbers in unusually warm 1991 (909 specimens) and unusually cold 1993 (682 specimens).^Â Identification sheet of whales and dolphins in the Dutch Caribbean. View full-text. Discover more. Sperm Whale in Kaikoura, New Zealand | ^Â© Bernard Spragg/Flickr. Save to Wishlist. New Zealand is a place for wildlife encounters. Migratory whales pass by the country^Â's shores year-round, so getting up close and personal with these amazing creatures only requires a bit of knowledge of where to go. This guide will showcase all the key places to watch the whales as they make the most of their natural surroundings. Kaikoura. There^Â's a good reason Kaikoura has been dubbed the ^Â'whale watching capital^Â' of New Zealand.^Â A resident population of Bryde^Â's whales is commonly seen swimming alongside the visiting bottlenose and common dolphins as well as orca, pilot whales, and humpback whales.

The Hector's dolphin is endangered and the Maui's dolphin is critically endangered. Both animals live around New Zealand and are killed in fishing nets. Both animals are relatively small members of the order Cetacea, which includes whales, dolphins, and porpoises. They are light grey animals with black and white markings and have a uniquely shaped dorsal fin along their backs. This fin is rounded instead of being sickle-shaped as in other dolphins. It's often said to look like one of Micky Mouse's ears. New Zealand consists of two sections—the North Island and the South Island. Dolphins can be found by both islands. Biological Classification. Hector's and Maui's dolphins are classified in the same genus and species (the fir

According to Project Jonah, a whale rescue group, New Zealand has one of the highest rates of whale strandings in the world, and on average about 300 whales and dolphins beach themselves on Kiwi shores every year. The reasons for whales strandings are still unclear, but it is thought a combination of factors contribute, with old, sick and injured whales being particularly vulnerable. Navigational errors among pods are also common, especially when chasing food or coming close to shore to avoid predators such as orcas. Since 1840, more than 5,000 whales and dolphins have beached themselves on Ne... Field / Identification Guide Out of Print. By: Alan N Baker. 133 pages, Col photos, b/w photos, bw illus. Whales & Dolphins of New Zealand and Australia: an identification guide. Jan 1999. A N Baker. Baker, A. N. 1999. Whales & Dolphins of New Zealand and Australia: an identification guide. Victoria University Press, Wellington.

To assist in the species-level identification of stranded and hunted beaked whales, we compiled a database of 'reference' sequences from the mitochondrial DNA control region for 15 of the 20 described ziphiid species. Reference samples for eight species were obtained from stranded animals in New Zealand and South Australia. Sequences for a further seven species were obtained from a previously published report. This database was used to identify 20 'test' samples obtained from incompletely documented strandings around New Zealand.
